MONTANA MALTING BARLEY UTILIZED TO PRODUCE MALT--1992 CROP

Maltsters and brewers purchased 10.1 million bushels of Montana's 1992 barley crop to make malt. This was 29 percent less than 1991 and 18 percent less than 1990. The 1992 malt barley utilization represented 19 percent of the total 1992 barley crop compared with 17 percent in 1991 and 22 percent in 1990.

Montana growers planted 1.35 million acres of barley in 1992. Of the total, about 467 thousand acres were planted to malting varieties. If the yield of malting varieties equaled the state average yield per planted acre for all barley then approximately 18.3 million bushels of malting type barley would be produced. Since 10.1 million bushels were used for malt the remaining 8.2 million bushels either did not make the malting grade or exceeded the demand for malting barley.

The average protein of the 1992 malting barley purchases was 12.1 percent. This is 0.2 lower than the 12.3 percent last year and 0.8 lower than the 12.9 percent of 1990.

This survey was requested and funded by the Montana Wheat and Barley Committee.

Special thanks to the maltsters, brewers, and grain firms who cooperated in furnishing data.

MONTANA MALTING BARLEY UTILIZED TO PRODUCE MALT--1993 CROP

Maltsters and brewers purchased 13.7 million bushels of Montana's 1993 barley crop to make malt. This was 36 percent more than 1992, but 4 percent less than 1991. The average protein of the 1993 malting barley purchases was 11.5 percent. This is 0.6 lower than the 12.1 percent last year and 0.8 lower than the 12.3 percent of 1991.

Montana growers planted 1.3 million acres of barley in 1993. Of the total, about 432.0 thousand acres were planted to malting varieties. If the yield of malting varieties equaled the state average yield per planted acre for all barley then approximately 21.2 million bushels of malting type barley would be produced. Since 13.7 million bushels were used for malt the remaining 7.5 million bushels either did not make the malting grade or exceeded the demand for malting barley. The 1993 malt barley utilization represented 22 percent of the total 1993 barley crop compared with 19 percent in 1992 and 17 percent in 1991.

MONTANA MALTING BARLEY UTILIZED TO PRODUCE MALT--1994 CROP

Maltsters and brewers purchased 15.3 million bushels of Montana's 1994 barley crop to make malt. This was 11 percent more than 1993 and 51 percent more than 1992. The average protein content of the 1994 malting barley purchases was 12.1 percent. This is 0.6 points higher than last year, but the same as 1992.

Montana growers planted 1.3 million acres of barley in 1994. Of the total, about 485 thousand acres were planted to malting varieties. If the yield of malting varieties equaled the state average yield per planted acre for all barley, then approximately 19.7 million bushels of malting type barley would have been produced. Since 15.3 million bushels were used for malt, the remaining 4.4 million bushels either did not make the malting grade or exceeded the demand for malting barley. Barley utilized for malt represented 29 percent of the total 1994 barley crop compared with 22 percent of the total in 1993 and 19 percent in 1992.

This survey was requested and funded by the Montana Wheat and Barley Committee.

Special thanks to the maltsters, brewers, and grain farms who cooperated in furnishing data.

MONTANA MALTING BARLEY UTILIZED TO PRODUCE MALT--1995 CROP

Maltsters and brewers purchased 20.1 million bushels of Montana's 1995 barley crop to make malt. This was 32 percent more than 1994 and 47 percent more than 1993. The average protein of the 1995 malting barley purchases was 11.8 percent. This is 0.3 lower than the 12.1 percent last year and 0.3 higher than the 11.5 percent for 1993.

Montana growers planted 1.3 million acres of barley in 1995. Of the total, about 477 thousand acres were planted to malting varieties. If the yield of malting varieties equaled the state average yield per planted acre for all barley then approximately 22.9 million bushels of malting type barley would be produced. Since 20.1 million bushels were used for malt the remaining 2.8 million bushels either did not make the malting grade or exceeded the demand for malting barley. The 1995 malt barley utilization represented 32 percent of the total 1995 barley crop compared with 29 percent of the total in 1994 and 22 percent in 1993.

This survey was requested and funded by the Montana Wheat and Barley Committee.

Special thanks to the maltsters, brewers, and grain farms who cooperated in furnishing data.

Montana Malting Barley Utilized to Produce Malt--1996 Crop

Maltsters and brewers purchased 18.7 million bushels of Montana's 1996 barley crop to make malt, down 7 percent from the previous year. The average protein of the 1996 malting crop was 12.4 percent, compared with 11.8 percent for the 1995 crop.

Montana growers planted 1.3 million acres of barley in 1996, unchanged from the previous year. Of the total, about 577 thousand acres were planted to malting type varieties. If the yield of malting varieties equaled the state average yield per planted acre for all barley then approximately 22.9 million bushels of malting type would be produced. Since only 18.7 million bushels were used for malt the remaining 4.2 did not make the malting grade or exceeded demand for malting barley. The 1996 malt barley utilized represented 36 percent of the total 1996 barley crop compared with 32 percent in 1995 and 29 percent in 1994.

This survey was requested and funded by the Montana Wheat and Barley Committee.

Special thanks to the maltsters, brewers, and grain farms who cooperated in furnishing data.

Montana Malting Barley Utilized to Produce Malt--1997 Crop

Maltsters and brewers purchased 23.8 million bushels of Montana's 1997 barley crop to make malt, 27 percent more than purchased the previous year. The average protein of the 1997 malting crop was 12.4 percent, which was the same as the 1996 crop. Last fall's lack of rain and frost provided growers a long harvest window that resulted in a great malt barley crop.

Montana growers planted 1.3 million acres of barley in 1997, unchanged from the previous year. Of the total, about 539,000 acres were planted to malting-type varieties approved by the American Malting Barley Association. If the yield of malting varieties equaled the state average yield per planted acre for all barley then approximately 26.4 million bushels of malting barley were produced. Since only 23.8 million bushels were used for malt the remaining 2.6 million bushels did not make the malting grade or exceeded demand for malting barley. The 1997 barley utilized for malt represented 37 percent of barley production compared with 36 percent utilized in 1996 and 32 percent utilized for malt in 1995.

Barley for Malt 1998 Crop

STATE DOCUMENTS COLLECTION

MONTANA STATE LIBRARY
1515 P. O. BOX 100
HELENA, MONTANA 59626-0100

Released: October 25, 1999

Maltsters and Brewers Purchased 17.9 Million Bushels of the 1998 Barley Crop

Maltsters and brewers purchased 17.9 million bushels of Montana's 1998 barley crop to make malt, down nearly 25 percent from 1997 and down 4 percent from the 1996 crop year, according to a recent survey conducted by the Montana Agricultural Statistics Service. The survey was requested and funded by the Montana Wheat and Barley Committee. The average protein of the 1998 malting crop was 12.6 percent, compared with 12.4 percent for the 1997 crop.

Montana growers planted 1.35 million acres of barley in 1998, up 100,000 acres from 1997. Of the total, about 690 thousand acres were planted to malting type varieties. If the yield of malting varieties equaled the state average yield per planted acre for all barley then approximately 33.0 million bushels of malting type would be produced. Since only 17.9 million bushels were used for malt the remaining 15.1 did not make the malting grade or exceeded demand for malting barley. The malt barley utilized represented over 31 percent of the 1998 total barley crop compared with 39 percent in 1997 and 38 percent in 1996.

Harrington was the variety most frequently purchased by Maltsters and brewers and represented 63 percent of the total purchases. Anheuser Bush varieties were the second most commonly purchased. Sixty-six percent of all malt barley purchased was grown in North Central Montana. Central Montana growers produced 19 percent of the total.

This survey was requested and funded by the Montana Wheat and Barley Committee.

Special thanks to the maltsters, brewers, and grain farms who cooperated in furnishing data.

Released: September 25, 2000

Maltsters and Brewers Purchased 19.4 Million Bushels of the 1999 Barley Crop

Maltsters and brewers purchased 19.4 million bushels of Montana's 1999 barley crop to make malt, up 8 percent from 1998, but down nearly 19 percent from the 1997 crop year, according to a recent survey conducted by the Montana Agricultural Statistics Service. The survey was requested and funded by the Montana Wheat and Barley Committee. The average protein of the 1999 malting crop was 12.6 percent, which is the same average protein obtained from the 1998 crop.

Montana growers planted 1.30 million acres of barley in 1999, down 50,000 acres from 1998. Of the total, about 780,000 acres were planted to malting type varieties. If the yield of malting varieties equaled the state average yield per planted acre for all barley, then approximately 34.5 million bushels of malting type would be produced. Since only 19.4 million bushels were used for malt, the remaining 15.1 did not make the malting grade or exceeded demand for malting barley. The barley utilized for malt represented nearly 34 percent of the 1999 total barley crop compared with 31 percent in 1998 and 39 percent in 1997.

Harrington was the variety most frequently purchased by Maltsters and brewers and represented 52 percent of the total purchases. Anheuser Busch varieties were the second most commonly purchased. Seventy-six percent of all malt barley purchased was grown in North Central Montana. South Central Montana growers produced nearly 13 percent of the total.

This survey was requested and funded by the Montana Wheat and Barley Committee.

Maltsters and Brewers Purchased 13.1 Million Bushels of the 2000 Barley Crop

Maltsters and brewers purchased 13.1 million bushels of Montana's 2000 barley crop to make malt, down 33 percent from 1999, according to a recent survey conducted by the Montana Agricultural Statistics Service. The survey was requested and funded by the Montana Wheat and Barley Committee. The average protein of the 2000 malting crop was 12.4 percent, which is 0.2 percent less than the average protein obtained from the 1999 crop.

Montana growers planted 1.25 million acres of barley in 2000, down 50,000 acres from 1999. Of the total, over 823,000 acres were planted to malting type varieties. If the yield of malting varieties equaled the state average yield per planted acre for all barley, then approximately 25.0 million bushels of malting type would have been produced. Since only 13.1 million bushels were used for malt, the remaining 11.9 did not make the malting grade or exceeded demand for malting barley. The barley utilized for malt represented approximately 34 percent of the 2000 total barley crop compared with 34 percent in 1999 and 31 percent in 1998.

Anheuser Busch varieties were the most frequently purchased by maltsters and brewers and represented 42.4 percent of the total purchases. Harrington varieties were the second most commonly purchased. Seventy-one percent of all malt barley purchased was grown in North Central Montana. South Central Montana growers produced over 19 percent of the total.

This survey was requested and funded by the Montana Wheat and Barley Committee.

Special thanks to the maltsters, brewers, and grain farms who cooperated in furnishing data.

Bar Malt 2001 Crop

Released: September 25, 2002

Maltsters and Brewers Purchased 7.5 Million Bushels of the 2001 Barley Crop

Maltsters and brewers purchased 7.5 million bushels of Montana's 2001 barley crop to make malt, down 42 percent from 2000, according to a recent survey conducted by the Montana Agricultural Statistics Service. The survey was requested and funded by the Montana Wheat and Barley Committee. The average protein of the 2001 malting crop was 12.2 percent, which is 0.2 point less than the average protein obtained from the 2000 crop.

Montana growers seeded 1.10 million acres of barley in 2001, down 150,000 acres from 2000. Of the total, over 650,000 acres were seeded to malting type varieties. If the yield of malting varieties equaled the state average yield per planted acre for all barley, then approximately 17.4 million bushels of malting type would have been produced. Because only 7.5 million bushels were used for malt, the remaining 9.9 million bushels did not make the malting grade or exceeded demand for malting barley. The barley utilized for malt represented approximately 26 percent of the 2001 total barley crop compared with 34 percent in both 2000 and 1999.

Anheuser Busch varieties were the most frequently purchased by maltsters and brewers and represented 46.3 percent of the total purchases. Harrington varieties were the second most commonly purchased. Seventy-one percent of all malt barley purchased was grown in North Central Montana. South Central Montana growers produced over 17 percent of the total.

This survey was requested and funded by the Montana Wheat and Barley Committee.

Special thanks to the maltsters, brewers, and grain farms who cooperated in furnishing data.

Maltsters and Brewers Purchased 9.3 Million Bushels of the 2002 Barley Crop

Maltsters and brewers purchased 9.3 million bushels of Montana's 2002 barley crop to make malt, up 23 percent from 2001, according to a recent survey conducted by the Montana Agricultural Statistics Service. The survey was requested and funded by the Montana Wheat and Barley Committee. The average protein of the 2002 malting crop was 13.0 percent, which is 0.8 point more than the average protein of the 2001 crop.

Montana growers seeded 1.20 million acres of barley in 2002, up 100,000 acres from 2001. Of the total, over 740,000 acres were seeded to malting type varieties. If the yield of malting varieties equaled the state average yield per planted acre for all barley, then approximately 24.6 million bushels of malting type would have been produced. Because only 9.3 million bushels were used for malt, the remaining 15.3 million bushels did not make malting grade or exceeded demand for malting barley. The barley utilized for malt represented approximately 23 percent of the 2002 total barley crop, compared with 26 and 34 percent in 2001 and 2000, respectively.

Harrington was the most frequently purchased variety by maltsters and brewers and represented 37 percent of the total purchases. Anheuser-Busch varieties, at 36 percent of total, were the second most commonly purchased. Fifty-eight percent of all malt barley purchased was grown in north central Montana, compared to 71 percent last year. South central Montana growers produced 23 percent of the total.

This survey was requested and funded by the Montana Wheat and Barley Committee.

Special thanks to the maltsters, brewers, and grain farms who cooperated in furnishing data.

Maltsters and Brewers Purchased 14.8 Million Bushels of the 2003 Barley Crop

Maltsters and brewers purchased 14.8 million bushels of Montana's 2003 barley crop to make malt, up 59 percent from 2002, according to a recent survey conducted by the Montana Agricultural Statistics Service. The survey was requested and funded by the Montana Wheat and Barley Committee. The average protein of the 2003 malting crop was 12.2 percent, which is 0.8 point lower than the average protein of the 2002 crop.

Montana growers seeded 1.15 million acres of barley in 2003, down 30,000 acres from 2002. Of the total, over 719,000 acres were seeded to malting type varieties. If the yield of malting varieties equaled the state average yield per planted acre for all barley, then approximately 21.3 million bushels of malting type would have been produced. Because only 14.8 million bushels were used for malt, the remaining 6.5 million bushels did not make malting grade or exceeded demand for malting barley. The barley utilized for malt represented approximately 47 percent of the 2003 total barley crop, compared with 24 and 26 percent in 2002 and 2001, respectively.

Harrington was the most frequently purchased variety by maltsters and brewers and represented 41 percent of the total purchases. Anheuser-Busch varieties, at 37 percent of total, were the second most commonly purchased. Sixty-eight percent of all malt barley purchased was grown in north central Montana, compared to 58 percent last year. South central Montana growers produced 19 percent of the total.

This survey was requested and funded by the Montana Wheat and Barley Committee.

2004 Crop

Released: October 7, 2005

Maltsters and Brewers Purchased 19.7 Million Bushels of the 2004 Barley Crop

Maltsters and brewers purchased 19.7 million bushels of Montana's 2004 barley crop to make malt, up 33 percent from 2003, according to a recent survey conducted by the USDA, NASS-Montana Field Office. The survey was requested and funded by the Montana Wheat and Barley Committee. The average protein of the 2004 malting crop was 12.0 percent, which is 0.2 points lower than the average protein of the 2003 crop.

Montana growers seeded 1.00 million acres of barley in 2004, down 150,000 acres from 2003. Of the total, over 700,000 acres were seeded to malting type varieties. If the yield of malting varieties equaled the state average yield per planted acre for all barley, then approximately 34.3 million bushels of malting type would have been produced. Because only 19.7 million bushels were used for malt, the remaining 14.6 million bushels did not make malting grade or exceeded demand for malting barley. The barley utilized for malt represented approximately 40 percent of the 2004 total barley crop, compared with 43 and 24 percent in 2003 and 2002, respectively.

Harrington was the most frequently purchased variety by maltsters and brewers and represented 35 percent of the total purchases. Anheuser-Busch varieties, at 27 percent of total, were the second most commonly purchased. Fifty-two percent of all malt barley purchased was grown in North Central Montana, compared to 60 percent last year. South Central Montana growers produced 18 percent of the total.

This survey was requested and funded by the Montana Wheat and Barley Committee.

Maltsters and Brewers Purchased 22.5 Million Bushels of the 2005 Barley Crop

Maltsters and brewers purchased 22.5 million bushels of Montana's 2005 barley crop to make malt, up 14 percent from 2004 and up 52 percent from the 2003 crop year, according to a recent survey conducted by the USDA, NASS, Montana Field Office. The survey was requested and funded by the Montana Wheat and Barley Committee. The average protein of the 2005 malting crop was 12.2 percent, which is 0.2 points higher than the average protein of the 2004 crop. Average plumpness increased 2 percent from the 2004 crop to 86 percent.

Montana growers planted 900,000 acres of barley in 2005, down 100,000 acres from 2004. Of the total, 515,000 acres were planted to malting barley varieties. The malt barley utilized represented 57 percent of the 2005 total barley crop, compared with 40 percent in 2004 and 43 percent utilized in 2003.

Anheuser-Busch varieties were the most frequently purchased by maltsters and brewers and represented 41 percent of the total purchases. Harrington and Metcalfe were also commonly purchased varieties at 28 percent and 17 percent, respectively. Sixty-five percent of all malt barley purchased was grown in North Central Montana. Northeast Montana growers produced 15 percent of the total, and South Central growers accounted for 10 percent of the malt barley total.

This survey was requested and funded by the Montana Wheat and Barley Committee.

Maltsters and Brewers Purchased 21.5 Million Bushels of the 2006 Montana Barley Crop

Maltsters and brewers purchased 21.5 million bushels of Montana's 2006 barley crop to make malt, down 4 percent from 2005 and up 9 percent from the 2004 crop year, according to a recent survey conducted by the USDA, NASS, Montana Field Office. The survey was requested and funded by the Montana Wheat and Barley Committee. The average protein of the 2006 malting crop was 12.3 percent, which is 0.1 points higher than the average protein of the 2005 crop. Average plumpness decreased 2 percentage points from the 2005 crop to 84 percent.

Montana growers planted 770,000 acres of barley in 2006, down 130,000 acres from 2005. Of the total, approximately 486,000 acres were planted to malting barley varieties. The malt barley utilized represented 69 percent of the 2006 total barley crop, compared with 57 percent in 2005 and 40 percent utilized in 2004.

Harrington was the most frequently purchased variety by maltsters and brewers this year. Harrington accounted for 38 percent of the total purchases. Metcalfe, Merit, and Tradition were also commonly purchased varieties at 21 percent, 12 percent, and 10 percent of the total, respectively. Forty-eight percent of all malt barley purchased was grown in North Central Montana compared with 65 percent of the previous year's crop and 52 percent of the 2004 crop. Twenty-one percent was purchased from Central Montana growers, and 14 percent of the total was purchased from the Northeast district.

This survey was requested and funded by the Montana Wheat and Barley Committee.
